

Scott Centennial Catalogue numbers

Number System

I've put these together from www.vistastamps.com, Ebay, and Catalogues I have

I have these catalogues

1. Canada Cover Catalogue, 6th ed, Tom McAlpin, Will Gandley. [superficial]
2. Canada/BNA Postal Stamp Catalogue, 9th, Will Gandley, Dwight Stanley.
[Good book but Scott catalogue system is right for 1978, but wrong now]
3. Centennial definitives of Canada, 1972, David Gronbeck-Jones. [good info but devoid of any universal catalogue system]
4. Canada & Newfoundland, Postal Stationery Catalogue, 1974, J.F. Webb. [arbitrary catalogue numbers]
5. Scott Catalogue Volume 1, 1992. [ironically worthless]
6. Scott Catalogue Volume 1a, 1996. [ironically worthless]
7. Guidebook & Catalogue of Canadian Stamps, 2nd ed, Glenn Hansen
[Fantastic, so much useful info, interesting reading, useless number system]

Prices

I view catalogue pricing as a relative rather than absolute measure of rarity. Dealer and Ebay asking prices are more realistic, and those are the numbers I cite as reference, in December 2017.

Fluorescence (reflectivity of light)

Regarding only the Canadian Centennials, only plain, white, or hibrite were intentionally produced, and I have a catalogue from 1978 that acknowledges only these. Undoubtedly there is more variation. **To properly evaluate, the stamp should be on a black background, in a blackened enclosure containing both a UV transmitter whose wavelength and intensity are adjustable, and a light meter that concurrently measures wavelength and intensity.** No one uses such an apparatus, so it is down to experience and the unique response of an individual's pair of eyes. Often other clues are needed to identify a stamp.

Fluorescence	
<u>Subjective</u>	Objective
Dead Paper (Dead)	Plain (PL)
Non-Flourescent (NF) "plain"	
Dull Fluorescent (DF) "plain"	
Low Fluorescent (LF) "white"	White (CR cream)
Medium Fluorescent (MF)	
High Fluorescent (HF)	Hibrite
Hibrite (HB)	

Male Colour Blindness

One in 5 men have a [colour deficiency](#), often red-green. You can [test your vision online](#). I don't know how this could relate to UV vision response, but if you have deficiency, get a second opinion from someone who does not, and compare.

Centennial Gum

(Paraphrased from reference #3)

Dextrine gum (mistakenly sometimes called gum arabic) was the original gum used by the CBNC, before the BABNC began using Polyvinyl Alcohol (PVA). PVA eventually displaced Dex. BABNC applied their own PVA while CBNC bought their paper pregummed, so there is visual difference.

Dex gum is a starch base: shiny and sticky to the touch. Traditionally it is a yellow to brownish colour, although a clear white dex gum is found on some hibrite paper.

PVA is a dull surfaced gum that is usually colourless and not sticky. It has been called a “tropical” gum because unlike dex it does not absorb moisture from the air in humid climates. It also does not tend to curl the paper. On CBNC issues it is nearly invisible while on BABNC issues it is thicker and sometimes has a lumpy appearance.

Special gum was used on the 10c hibrite. It is colourless, applied more or less in a streaky pattern, and shiny. Assume it is dex unless someone analyzes it to reveal something “special”.

KISS Print / Squash-Effect Doubling

These are offset printed, and sometimes the rubber blanket “bounced” a bit. So it is a kiss print. “Many older dealers and serious collectors refer to this as “Squash-Effect Doubling””.

Tagging and Errors

My own observation is that “General” “Ottawa” Fluorescent tagging is clean, modern, sharp and easy to spot with a UV lamp – you know it when you see it, yellow with a dash of orange (on booklets, not so: faint stripe). The older “Winnipeg” phosphor tagging is sometimes faint and is generally inferior. It is said that the phosphor tagging glows in the dark like a glow in the dark frisbee after being charged up. I have not seen even the slightest such effect on any of them and I suspect it is an eye test anyone over 20 would fail.

Here is an excellent website that explains tagging and is a portal into the universe of tagging errors.

<http://www.adminware.ca/tagging/tagresults.php>

http://www.adminware.ca/tagging/tag_term.htm

Perforation

I have a box of gauges and conclude that only one of clear plastic vernier type is accurate and easy to use. “Imperforate” means a stamp off centre, and mis-perforate means alignment so askew the image got perforated.

Catalogue Numbers and prices

Like modern programming languages, web design languages and many housing developments, stamp number systems have evolved arbitrarily with no forethought and exhibit occasional flashes of logic and order. Competing schemes in this case have narrowed to the Scott numbers, but even those have evolved over time. My 1996 Scott catalogue devotes a quarter page to the entire Centennial story – useless. Is a modern Scott eCatalogue any better?

Only one thing matters.....**Catalogue numbers are worthless unless they are defined.**

I define them here, as I understand them. The 460 6c is exceptionally poorly itemized so I include also a table of evolving Scott numbers from 1978 as an aid to clarify ambiguities in the main table. I do this for some other values also.

Abbreviations:

W2B = Winnipeg 2-bar phosphor tag,

w1b= Winnipeg 1-bar phosphor tag,

WCB=winnipeg centre bar

wl= winnipeg left tag,

wr=winnipeg right tag

Dex = Dextrose, wg=white gum

PVA=Polyvinylacetate

CNBC= Canadian Bank Note Co

fh= Fluorescent somewhat Hibrite paper

hibrite=extremely fluorescent

fi=fluorescent ink

pogs=printed on gum side

p=tagged. Example 454p

GT2= general tagging on two opposite sides. (fluorescent but not glowing phosphor). Known as Ottawa tagging where it first began.

NF,DF,LF,MF,HF= Fluorescence: No, dull, low, medium, high (hibrite)

swg=spotty white gum

Htp =hard translucent paper

white=white paper. Likely same as LF

ribbed=horizontally ribbed paper

CR=Cream paper, Creamish white colour to the naked eye

PL= Plain paper, white to the naked eye

se-tenant=[different face values joined on one pane](#)
